P R E F A C E .

IN the reports written on the decennial enumerations of the Presidency, it has been of late the custom to treat Madras as a "district," and to devote a space necessarily brief to criticism of its advancement or decline as a whole. The liberality of the Madras Corporation has enabled me to publish the present statistics, which endeavour to exhibit the city, and its twenty municipal, divisions in the relation wherein the Imperial Report considers the Presidency and its districts.

No one can be more sensible than myself of the sins of omission and commission that may be cast up to this little volume. There is much in the tables that I would omit, and much wanting that I would add, were I to commence the work afresh; while I am sadly conscious of the baldness of my introductory remarks, when compared with the masterly report which Mr. Gover commenced forty years ago, but by the accident of death left unfinished. But if the publication is repeated, as I hope it will be, ten years hence, these imperfect tables will be at least material, which my successor may mould afresh and better; while my brief comments and criticisms may serve the purpose of pegs on which informing discussions may be hung.

My thanks are due to many for their aid in this work such as it is. To Mr. Alfred Chatterton for the chapter on industries which concludes the introduction; to Mr. J. W. Madeley and Dr. T. M. Nair for many helpful suggestions; to Messrs. T. Raghaviah and E. Nicholas for the care and accuracy with which they carried out the enumeration of the city. While here too, as in the more general work of the Presidency census, I have incurred large debts of energy and good-will to Messrs. S. Dandapani Aiyar and A. K. Kuppusami Aiyar of my personal office, and to Mr. T. Fisher, Superintendent of the Government Press.

STATISTICAL TABLES

FOR THE

CITY OF MADRAS.

INTRODUCTORY REMARKS.

CHAPTER I.

MOVEMENT OF THE POPULATION IN THE CITY AS A WHOLE (TABLES I, II AND VI).

The movement of population in the city of Madras for the past forty years can be seen thus :—

1871	397,552
1881	405,848
1891	452,518
1901	509,346
1911	518,660

The decennial increase has been—

		Absolute.	Per cent.
1871-81	...	8,296	2·1
1881-91	...	46,670	11·5
1891-01	...	56,828	12·6
1901-11	...	9,314	1·8

Thus the increase, absolute and proportional, for the past decade is immeasurably below that of the preceding two decades. Although the absolute increase is slightly greater than that of the decade 1871-81, in which occurred the great famine of 1877, the percentage increase is lower.

It cannot be denied that these results have to a large extent falsified expectations. Numerous explanations can be given; of which the first and most obvious takes the form of an attack on the accuracy of the returns. But I do not think that there are any reasonable grounds for doubting that the returns are as correct as it is humanly possible to make them. The census arrangements made by Messrs. Raghaviah and Nicholas were admirably complete, and in the course of a long inspection on the census night I satisfied myself as to the care and precision with which they were carried out. In one way, it is true, the excellence of these arrangements may have caused a slight falling off in the totals in comparison with those of 1901, as extreme care was taken to avoid double enumeration.

I think then that we must look for explanation in what I shall call "mechanical" or "natural" causes.

By "mechanical" causes I understand removal of large defined bodies of men from city limits, cessation of large industries, or completion of large temporary works, removal of people to suburbs outside the city area, emigration and immigration. By "natural" causes I understand a growing unhealthiness of the city, or a diminishing fecundity of the people. Discussion of this latter question may best be postponed to Chapter III, which treats primarily of the age periods of the people.

Examination of what I have called "mechanical" causes demands an intimate knowledge of the industrial life of the city which I do not possess. I may however quote a few instances which have been suggested to me.

I understand that in 1901 some troops were stationed in the neighbourhood of Perambúr. These, with their followers, had been removed before March 10th, 1911 (the census night). Saddlery and harness works in the same neighbourhood had similarly ceased to exist.

The Gun Carriage Factory in Poonamallee road, which at the census of 1901 was employing some thousands of hands, had been closed down by the census time of 1911.

The following statement shows a total increase of 6,013 in certain residential quarters outside the city municipal limits :—

Name of place.	Population according to the census of 1911.			Population according to the census of 1901.		
	Total.	Males.	Females.	Total.	Males.	Females.
Kódambákkanm	1,521	778	743	2,559	1,322	1,237
Saidapet Union	15,646	7,966	7,680	14,254	7,253	7,001
St. Thomas' Mount	15,546	7,794	7,752	15,571	7,623	7,948
Pallávaram	7,059	3,555	3,504	6,416	3,331	3,085
Sembiam Union	21,325	11,000	10,325	17,567	8,876	8,691
Villivákkanm	923	461	462	704	354	350
Konnúr	1,978	992	986	1,398	723	675
Tiruvallúr Union	9,576	4,662	4,914	9,092	4,476	4,616
Total ...	73,574	37,208	36,366	67,561	33,958	33,603

No doubt all these causes may have contributed to the detriment of increase in the city. Yet even if we suppose their value to have been 15,000 in the decade, and add such number to the actual ascertained increase, we only get a total increase of 24,314 (or 4·8 per cent.), which still contrasts very unfavourably with the figures of the two preceding decades.

The following return taken from table VI is interesting in regard to emigration and immigration. It shows for successive decades the numbers of those who were born in Madras and were enumerated there, and the numbers of immigrants from other districts :—

	1891.			1901.			1911.		
	Total.	Males.	Females.	Total.	Males.	Females.	Total.	Males.	Females.
* Born in Madras	325,346	159,372	165,974	348,723	171,769	176,954	345,317	172,729	172,588
	382,908	186,775	196,133	402,813	197,971	204,842	403,325	199,849	203,476
Immigrants	127,172	66,445	60,727	160,623	84,961	75,662	173,343	93,736	79,607

* Numerator = Number of persons born in Madras and enumerated there.
Denominator = Total number of persons born in Madras.

These figures seem to indicate that between 1891 and 1901 it was becoming increasingly worth a man's while, if he was born in Madras, to remain there, while for the decade 1901-1911 the conditions seem to have been reversed. Women born in the city seem to be leaving it in increasing numbers; possibly owing to the rate for sons-in-law ruling lower in the mufassal than in the city; possibly because for caste and other social reasons the daughters of immigrants are given away in marriage at their ancestral homes.

Immigration figures show that the city is losing its attractiveness. An increase of 12,720 immigrants between 1901 and 1911 compares poorly with one of 33,451 between 1891 and 1901.

Table VI, to which a passing reference has been made already shows the district of birth returned by each person enumerated in the city. The following statement reduces it to a more comprehensible form :—

Birth place.								1911.	1901.	1891.
<i>Madras Presidency.</i>										
East Coast, North	13,418	12,373	12,555
Deccan	3,119	2,631	2,512
Madras City	345,317	348,723	325,346
East Coast, Central	109,287	109,787	80,420
Do. South	21,019	16,190	13,335
West Coast	4,415	2,498	1,845
Feudatories	1,312	713	591
					Total	...	497,887	492,915	436,604	
<i>Outside the Presidency.</i>										
Mysore	5,341	4,531	4,096
Bombay	2,614	1,920	1,260
Hyderabad	2,318	1,886	1,965
Other Provinces, etc.	5,318	3,515	3,446
Foreign Possessions	2,189	2,022	2,340
Rest of Asia	582	381	450
United Kingdom	2,003	1,908	1,597
Rest of Europe	244	124	171
Other places	164	144	589
					Total	...	20,773	16,431	15,914	
					Grand Total	...	518,660	509,346	452,518	

The most noticeable feature here is the state of immigration from the central and southern divisions of the "East Coast districts." Immigration from the southern division has increased steadily, if slowly, since 1891; while immigration from the central division, after exceptional progress from 1891 to 1901, fails to show any advance in the last decade. A consideration of the following figures localises this change in an apparent return to their homes of immigrants from North and South Arcot; and suggests furthermore that we should look for some local condition, which in the decade 1891–1901 led to a somewhat remarkable migration to Madras from Chingleput, North Arcot and South Arcot, and which has apparently now lost its force in the two latter districts though not in the first :—

	District.			1911.	1901.	1891.
Chingleput	69,576	67,673	53,046
North Arcot	24,404	26,085	18,085
Salem	3,314	1,998	1,234
Coimbatore	2,134	1,463	936
South Arcot	9,859	12,568	7,119
			Total	109,287	109,787	80,420

It may very possibly be that the spread of groundnut cultivation, essentially the small man's crop, is keeping the people of South Arcot at home.

But it is very questionable whether this drying up of the stream of immigration to the city is any cause for lamentation. It may be a sign, and I think it is a sign, that industry is spreading surely if slowly throughout the Presidency, instead of being confined to its capital town; that the labourer is growing more assured of a decent life in his own homeland, and more distasteful of the huddled dreariness of the city slums.

Finally we may glance at the question of extra-Indian emigration. For Burma, where, I am informed by Dr. Nair, mills are run well nigh entirely by Madras labour, 1,260,000 persons left the Presidency in the decade 1901–1901. Of these some 325,000 sailed from the Port of Madras. Less than one million have returned in the same period, the net loss to the Presidency being over 270,000. It is but fair to assume that a certain proportion of these emigrants were inhabitants of the city, while many more from the outside districts, had they not gone to Burma, would have drifted into Madras.

CHAPTER II.

THE CITY DIVISIONS (TABLE II).

Table II shows the variation in population of each division since 1891.

It will be noticed that between 1891 and 1901 all divisions except I, V and VI showed an increase. In 1911 eight divisions show a falling off; but curiously enough division V has changed from decided decrease to decided increase. Of this however a very probable explanation has been suggested to me by Mr. J. W. Madeley. It is that at the census of 1901 the figures of divisions IV and V got mixed up, and a number of the inhabitants of V were credited to IV. Division IV in that year showed an increase of 5,839, which was somewhat strikingly great; while V showed a decrease of 2,852 when all adjacent divisions were increasing, or if losing, losing very slowly. Transfer (say) 3,000 from IV to V, and we have in 1901 an increase of 2,839 in IV, with one of 148 in V; a much more probable state of affairs. Then in 1911 we shall have a decrease of 292 in IV, with one of 1,378 in V.

In the period 1891 to 1911 all but four divisions (I, V, VI, IX) show an increase; and of these four, No. V, if the figures are to be accepted, has turned towards increase in the past ten years.

In the divisions increasing in 1901-1911 the rate of increase falls below that of the decade 1891-1901, except in the case of XX (Mylapore), where it has risen from 11·6 per cent. to 20·6; XIV (Kilpauk) 7·5 per cent. to 23·1; XII which remains constant. Here a reference to table IV may help consideration of the question whether there is in any division an increase in the vigorous section of the population, or whether there is a silting up of young children and old people.

A well nigh continuous decline in the proportion of females to males may be noticed. At the same time it must be admitted, that this phenomenon was almost as marked in the preceding decade of great increase as in the present one.

We may consider the separate city divisions with reference to their actual physical state.

By the side of the sea, division I has suffered to some extent from erosion. Some houses may have been lost, and nobody is likely to build on the ground overhanging the water's edge. But, on going a little inland, there seems to be no reason save one why the northern divisions should not improve, unless malaria is creeping in from Ennur. They should not be inherently more unhealthy than such divisions as X, XI, XII, etc., granted the housing obtainable in both quarters to be equally good. Indeed it may be observed that the percentage of children in these divisions is high (Table IV), which suggests that the locality is "residential" and not unhealthy. But the obvious reason why people avoid the extreme north-east of the city is that communications are bad—there are no tramways. If the bread-winner's work is far away, he has no cheap and easy means of getting to it.

Divisions IV, V, VII and VIII are the very heart of the city. Their population is the "fighting line" of industry, whose vacancies are likely to be filled up by adult immigrants rather than by natural increase. This view is borne out by the age distribution table. It is doubtful whether population here *can* expand more. The sea front is now covered with large blocks of business premises, and the tendency of modern times is for such to expand. There is no room left for small residential houses, procurable at a price that suits the shallow pocket or exiguous dhoti end. And Madras, it may be noted, is essentially a one storied, or at most two storied city. The enterprise of its landlords, and the inclination of its inhabitants, show no signs of materialising in the sky-scaling rabbit warrens of Bombay. Furthermore, although the reflection is hardly relevant to a particular locality, it may be queried whether extension of large industries and commerce is so likely to account for an increase in population in Southern India as in western countries. The characteristic of industry in India is an abundant supply of cheap, and on the whole rather inefficient labour, which machinery and a smaller number of skilled workmen tend to supplant: the same observation applies to commerce, where one may notice a horde of low-paid clerks doing the work entrusted to one fairly well-paid man in Europe.

With VI, XVI, XVII we come to large open spaces, such as the Fort Glacis, the surroundings of the High Court, the Island, Government House and Park, Napier Park, etc. There is no likelihood of these being turned into residential quarters, and consequently no great increase need be expected.

Looking at X and XIV we can descry considerable possibilities of increase. The big mills in X absorb a good deal of space, but a great deal of the rest of Perambur would bear a thicker settlement without inconvenience. Moreover the geographical position of Sembiam, Siruvallur, and some few others, suggests the boon (doubtless an appreciated boon for the inhabitants) of inclusion in Madras municipal limits.

Purasawakkam (XI) is fairly thickly settled, so is XII (Vepery). When we pass to Kilpauk (XIV) we get the first inklings of a question applicable to all the remaining western and southern divisions of the city. There is plenty of vacant space, but this space is represented by the large private compounds that stand for the chief excellence and amenity of Madras. Are these to fall a prey to the jerry builder, and if they do, will this be for the good or ill of the city?

Some few remarks as to the general aspects of city life may serve as a conclusion to this chapter and to its predecessor.

Of primary importance to the growth of a city are (*a*) good work with good wages; (*b*) health; (*c*) amusement.

Wages are on the whole good in Madras; that is to say the profit of a higher rate of pay than obtains in the country is not entirely swept away by increase in the cost of living. There are indications of a coming demand for well-paid labour: such as the introduction of water-works and drainage throughout the city, the probable extension of the use of electricity (including tramway extension), the alteration of the old Gun Carriage Factory into a Public Works Department Workshop, the building of a new Government Press, etc.

As regards health, the "plain common Indian," it is true, does not study the disquisitions of health officers. His simple criterion of salubrity is whether a place is feverish or not feverish: infantile mortality, which subsequent consideration will perhaps show as the root cause of Madras' tardy increase, the man in the street is apt to look upon as the unaccountable whim of Heaven.

But that all is well with the health and sanitation of Madras, not even its most admiring city father will assert, when he considers its death-rate: very possibly the same idea is beginning to strike home to his simpler brother. He has but to consider the Cooum (for the betterment of which savoury stream a project is now on foot), or recall the remark of a touring politician, who, when asked to visit a sewage farm, replied innocently that he thought he was already on the spot.

The attractions of "amusement" are far less potent in the east than in the west. The glamour of the music hall, which attracts the European rustic from the deadly dullness of the country side, has not its counterpart here. It is as easy and meritorious to feed Brahmans in the country village as in the city; and the national hot weather pastime of litigation can be enjoyed as well, as profitably, and as securely, before the District Munsif as in the High Court of Judicature.

CHAPTER III.

THE AGES OF THE POPULATION (TABLES III AND IV).

In this chapter to a consideration of the question of age we may add that of sex and civil condition, and thus perchance arrive at some conclusions as to the "natural causes" of increase or decrease alluded to in chapter I.

The following statement shows the movement and position of the population at certain age periods with reference to the same three fixed points: the enumerations of 1891, 1901 and 1911:—

HINDU.

Age period.	1891.	1901.	Variation.	1911.	Variation.
0-10 ...	85,104	96,675	+ 11,571	91,774	- 4,901
10-20 ...	64,338	80,013	+ 15,675	81,900	+ 1,887
20-40 ...	124,757	138,240	+ 13,483	147,350	+ 9,110
40 and over ...	84,798	95,720	+ 10,922	94,886	- 834
Total ...	358,997	410,648	+ 51,651	415,910	+ 5,262

MUHAMMADAN.

Age period.	1891.	1901.	Variation.	1911.	Variation.
0-10 ...	12,222	13,025	+ 803	13,016	- 9
10-20 ...	9,841	11,661	+ 1,820	12,244	+ 533
20-40 ...	16,975	18,340	+ 1,365	19,969	+ 1,629
40 and over ...	14,146	14,305	+ 159	13,940	- 365
Total ...	53,184	57,331	+ 4,147	59,169	+ 1,838

CHRISTIAN.

Age period.	1891.	1901.	Variation.	1911.	Variation.
0-10 ...	9,901	9,906	+ 5	9,587	- 319
10-20 ...	8,821	9,312	+ 491	9,136	- 176
20-40 ...	12,808	13,171	+ 343	14,343	+ 1,192
40 and over ...	8,212	8,589	+ 377	8,746	+ 157
Total ...	39,742	40,958	+ 1,216	41,812	+ 854

The age periods that I have selected I take to represent childhood, adolescence, the prime of life, and its decline. We note that 1901, as compared with 1891, shows a decided increase at each period in each religion. Of these four periods, the most likely to be affected by unfavourable circumstances are the first and last, namely childhood and old age. Consequently it is not surprising to find that in a decade apparently unfavourable, the small increase that has occurred is entirely in the strong sections of adolescence and manhood, while the extreme periods have changed from a positive increase to positive decrease.

Confining our attention to the rising generation, who after all are of most importance to the growth of the city, we find that among Hindus (who represent four-fifths of the population), the 1891 children of the age period 0-10 were 85,104. At the next enumeration these are represented by those in the age period 10-20, who number 80,013, thus showing a loss of 5,091. Drawing a comparison between similar age periods in 1901 and 1911, we find that the wastage is well nigh trebled and stands at 14,775.

Now the question arises whether this apparent falling off in children is due to a lack of possible parents to produce children, or the inability of such parents to preserve their children alive when born.

It is, I think, a fair assumption that a male Madrasi is most likely to beget children between the ages of 20 and 45, and a female to produce them between the ages of 15 and 35. People at these times of life I shall term "reproductive," and of these there were and are as follows :—

Year.							Males.	Females.
1891	93,121	86,372
1901	104,739	94,099
1911	113,212	97,893

I may mention that in 1901 quinquennial age periods were not distinguished between 20 and 40, and 40, and 60. I have therefore had to obtain the necessary figures for 1901 by calculations based on the data of 1891.*

One point strikes us, namely the steadily growing disproportion between males and females. The total increase of 56,828 between 1891 and 1901 was made up of an increase of 30,913 in males, and 25,915 in females. In the decade 1901–1911, while males increased by 9,735, females decreased by 421. The deficiency of suitable mates for the men of 1891 was slightly under 7,000 ; this has grown to over 10,000 in 1901, and to well nigh 16,000 in 1911.

Now the children aged 0–10 at the enumeration of 1901 probably represent those that the reproductive people of 1891 were able to produce and keep alive. These numbered 119,596. Such children in 1911, attributable to the reproductive people of 1901, number 114,377. We have therefore a larger number of possible parents to account for a smaller number of children. I have disregarded the influences of immigration and emigration of children, and have also left out of account parents and children, (they are very few), outside the main religions, Hindu, Muhammadan and Christian.

This statement of persons at reproductive ages represents what we may call the raw material of matrimony. The following figures show the use made thereof. I trust that the crudeness of my expressions will not bring a blush to the modest cheek of my readers.

Statement showing persons married at reproductive ages.

Year.							Males.	Females.
1891	68,768	69,980
1901	74,896	73,442
1911	82,044	78,808

These figures are somewhat striking. We notice that in 1891 there were enough and to spare of reproductive women for the men actually married (an excess of 1,212) ; in 1901 this has changed to a deficiency of 1,454, and this deficiency has risen to 3,236 in 1911.

Comparing the two sets of figures, we find that there were at the present census 31,168 males at the reproductive period of life, who returned themselves as unfettered by domestic cares. Should they desire to change their state, there were apparently but 19,085 brides of suitable age : the reality is somewhat worse than the appearance, for included in this total were 7,272 Hindu widows, who, for the purposes of increase, are presumably useless to the community.

We may now look at the Sanitary Commissioner's vital statistics for the last two decades.

Decade.	Births.			Deaths.			Excess of deaths over births.			
	Total.	Males.	Females.	Total.	Males.	Females.				
1891–1900	178,349	91,385	86,964	183,432	90,298	93,734	5,083
1901–1910	191,903	98,573	93,330	219,610	110,213	109,397	27,707

* A most unsatisfactory method. For it tacitly assumes that divergent tendencies produce identical results ; or vice versa.

The conclusion would seem to be that the difficulty lies, not so much in the producing of children, as in the keeping them alive when born. The fact that in the latter decade male deaths exceed female is of some significance. The general proportion may be assumed to extend to children; and though in earliest infancy male deaths in most countries exceed female, this general tendency may be assumed as neutralised in India by the undoubtedly greater solicitude shown for boys. Thus the preponderance of male deaths over female suggests that the causes of death have in the past decade been more numerous or more urgent than in the decade preceding.

We may now look at another question arising from a consideration of Table III. Even social reformers, most conservative of mankind, admit that there is little to be said for a system which burdens a boy with a wife, and the possibility of a family, before he is at an age to support either; and exposes an undeveloped girl to the stresses of sexual intercourse and maternity.

Assuming that a male should not marry until he has passed his twentieth and a girl till she has passed her fifteenth year we have the following comparative statement of persons who are, but who ought not to be, married.

Year.	HINDUS.		MUHAMMADANS.		CHRISTIANS.	
	Males.	Females.	Males.	Females.	Males.	Females.*
1901	2,640	4,513	194	413
1911	2,653	4,456	222	385

Here, one is glad to notice, Madras shows a real advance, inasmuch as it has not, on the whole, gone backwards in a space of ten years.

CHAPTER IV.

EDUCATION (TABLE V).

On a general view the progress of education, (or at least literacy), in the city would appear to be satisfactory. The standard of literacy adopted at this census and at that of 1901 was ability to write a letter and to read the answer to it. A brief comparative statement is subjoined :—

Year.	HINDUS.				MUHAMMADANS.				CHRISTIANS.			
	Literate.		Literate in English.		Literate.		Literate in English.		Literate.		Literate in English.	
	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females	Males	Females
1901	70,399	12,179	24,947	534	9,457	1,049	2,202	17	12,310	9,828	8,853	7,079
1911	86,630	19,681	34,592	1,089	11,674	2,135	3,056	74	13,045	10,516	10,143	7,424

Progress may be seen more clearly if the percentages of literates to total population at the two enumerations are compared.

Year.	HINDUS.		MUHAMMADANS.		CHRISTIANS.	
	Percentage of literates to population.		Percentage of literates to population.		Percentage of literates to population.	
	Male.	Female.	Male.	Female.	Male.	Female.
1901	33·8	6	31	3·6	60	48
1911	40·4	9	38	7	63	50

When looking at these proportional figures we must bear in mind the general movement of population in the decade, which has been as follows :—

	Male.	Female.
Hindus	+ 6,445	- 1,183
Muhammadans	+ 1,879	- 41
Christians	+ 517	+ 337

It is thus evident that the improvement in the percentage of literacy, especially among Hindu and Muhammadan women, is not due to any considerable diminution of the total numbers.

The great superiority of Christians in point of literacy is to be accounted for by the presence of a large number of Europeans and Eurasians in their ranks ; and by the fact that education is a most prominent feature in the missionary's scheme of things. "Rice and schools," a missionary once wrote to me, "will convert any number of Paraiyans"; to me they seem most excellent reasons for a change in one's theology. The returns of female education appear especially noteworthy. Education, with all its defects in India, is the key to progress. Women form one half of every community ; 91 per cent. of this Hindu half, and 93 per cent. of the Muhammadan half, still lack the key. The Christians with 50 per cent. of their women literate *must* forge ahead, whatever be the disadvantages with which they start. That Hindus and Muhammadans appear to recognise this fact will be evident from a few subsequent figures.

The vitality or progress of education may, generally speaking, be judged by the variation in the proportion of educated children to educated adults. If the proportion falls, then an uneducated generation is growing up : if it rises, then we may look for improvement among the coming adults, who are to be the strength of the community. The following figures show the proportion of literates aged 0-15 to 1,000 literates aged 20 and over.

Religion.	Males.		Females.	
	1901.	1911.	1901.	1911.
All religions	181	166	450	385
Hindu	175	162	496	423
Muhammadan	133	136	341	320
Christian	258	221	409	333

Now these figures look discouraging, but a little reflection shows that the bogie set up may very easily be knocked down. These figures are, I believe, the result of that falling off in the total number of children to which reference has already been made. This fact is indeed made abundantly clear by the following statement :—

Religion.	Proportional increase or decrease of population at age 0-15.		Proportional increase or decrease of literates at age 0-15.	
	Male.	Female.	Male.	Female.
	1901 to 1911.	1901 to 1911.	1901 to 1911.	1901 to 1911.
All religions	- 3·8	- 5·4	+ 12·8	+ 26·8
Hindu	- 4·9	- 6·4	+ 15·3	+ 46·0
Muhammadan	+ 2·8	- 1·6	+ 25·0	+ 95·9
Christian	- 4·3	- 3·5	- 6·0	- 7·1

Thus we see that while children have decreased in numbers, they have improved in education. For we cannot draw the improving but improbable conclusion that Heaven kills off the naughty children, who will not attend to their lessons. The figures in regard to Christian education are worth consideration, as they may tend to show that Christians are losing ground, while Hindus and Muhammadans are gaining. Especially is this the case with regard to female education, but the figures must be taken with some reservations. For when *absolute* numbers are very small, *proportional* figures are easily influenced, and are apt to be misleading.

Finally I append two statements showing proportional figures of literacy, and literacy in English, for each main religion at certain age periods in each division of the city. They may be of interest to future founders of schools.

Percentage of literates to population at certain ages by religions, sexes and divisions (1911).

CHAPTER V.

CASTE, RACE AND RELIGION (TABLES VII AND VIII).

Table VII gives us the caste, tribe, race and religion returned by every person at the last enumeration.

Disquisitions on racial peculiarity or social custom are out of place in dealing with the progress of a modern city. I shall only make use of this table in so far as it may enable us to localise certain details in the movement of the population.

Dealing first with Hindus, we get the following figures :—

Caste according to linguistic division.	1901.				1911.			
	Males.	Females.	Total.	Surplus or deficit of women.	Males.	Females.	Total.	Surplus or deficit of women.
Tamil	149,364	147,996	297,360	- 1,368	149,852	143,313	293,165	- 6,539
Telugu	48,123	47,564	95,687	- 559	49,757	47,909	97,666	- 1,848
Malayálam	573	100	673	- 473	1,270	218	1,488	- 1,052
Canarese	1,229	949	2,178	- 280	1,967	1,504	3,471	- 463
Oriya	73	119	192	+ 46	86	24	110	- 62
Other Madras ...	7,260	6,151	13,411	- 1,109	10,309	8,903	19,212	- 1,406
Other Foreign ...	593	435	1,028	- 158	296	214	510	- 82
Not stated ...	71	48	119	- 23	194	94	288	- 100
Total ...	207,286	203,362	410,648	- 3,924	213,731	202,179	415,910	- 11,552

Now the first point that strikes us in these figures, is the fact that, while Hindus show an increase of 5,262, this figure is reached by a decrease of 4,195 in the Tamil castes, and an increase of 9,457 elsewhere. Furthermore the decrease in Tamil castes is entirely on the female side : men have increased by 488, while women have decreased by 4,683. The disproportion between the sexes of the Tamil castes, which in 1901 was 1,368, has now risen to 6,539 ; and this to a large extent accounts for a sex disparity of 11,552 in the Hindu population, and one of 11,270 in the total population of the city.

It is not on the whole surprising that this sex disparity should be found in castes other than Tamil ; such are immigrants to the city, and may be expected to leave their women folk behind them ; thus an increasing disparity may be accounted for by increasing immigration. But that this disparity should be in the increase among the Tamils in their own chief city is certainly curious.

We may endeavour to localise this divergence somewhat more closely—

Caste.	1901.			1911.		
	Males.	Females.	Disparity.	Males.	Females.	Disparity.
Brahman	8,330	6,126	- 2,204	12,055	8,672	- 3,383
Kammálan	7,963	7,533	- 430	7,916	7,710	- 206
Palli	25,644	25,921	+ 277	26,069	24,140	- 1,929
Valluvan	752	726	- 26	2,035	893	- 1,142
Vannán	942	907	- 35	2,660	1,550	- 1,110
Vániyan	10,480	8,992	- 488	7,416	8,080	+ 664
Total ...	54,111	51,205	- 2,906	58,151	51,045	- 7,106

We notice here a somewhat disproportionate increase of Bráhmans, which increase is most marked on the male side. It is possible to account for this by the well known fact that Kammálans have commenced to find a strange satisfaction in calling themselves Bráhmans. Their total number has remained practically stationary (which is improbable), while their sex ratio has completely changed. It may be possible that Kammálans male and female have changed themselves into Bráhmans, but that owing to the innate conservatism of females the change has been less marked among them.*

Pallis have actually decreased in total numbers while their sex ratio has changed. A plausible explanation would be the desire on the part of the Pallis to style themselves Kshatriyas; a desire shared by Shánáns. The following figures lend corroboration to this view :—

Caste.	1901.				1911.			
	Males.	Females.	Total.	Sex disparity.	Males.	Females.	Total.	Sex disparity.
Palli	25,644	25,921	51,565	+ 277	26,069	24,140	50,209	- 1,929
Shánán	4,944	4,958	9,902	+ 14	3,971	3,745	7,716	- 226
Kshatriya	611	544	1,155	- 67	4,291	4,175	8,466	- 116

These figures suggest that a considerable number of Tamils have transferred themselves to the Kshatriya ranks and so swelled the numbers of "Madras—other languages" castes, and that in this transference sex proportions have become mixed. The following figures repeated give a succinct view of the question :—

Madras Castes—"Other Languages."

1901.				1911.			
Males.	Females.	Total.	Sex disparity.	Males.	Females.	Total.	Sex disparity.
7,260	6,151	13,411	- 1,109	10,309	8,903	19,212	- 1,406

Vannáns and Vániyans it is obvious have become mixed either in 1901 or in 1911. Schedules for the city were filled up in English, and the facilities for confusion are obvious.

The figures for Valluvans are inexplicable, and though they appear to swell the Tamil castes, they exercise a disturbing influence on sex ratio. The only explanation that I can suggest is that females of the caste may have returned themselves as Paraiyans, although this conjecture is not supported by figures either as regards total increase or maintenance of sex ratio. In 1901 Paraiyan women exceeded the men by 950; in 1911 by 473 only.

As regards Muhammadans and Christians no question appears to arise.

Those classed as others (Jew, Buddhist, Parsi, etc.), show a decided increase from a total of 404 (male 272, female 132) in 1901, to 1,769 (male 1,168, female 601) in 1911. As a reason therefor we may assign the presence of some Buddhist missionaries in the city, and an increased immigration of Parsis. The sex ratio of the city has been influenced somewhat by these figures. There is in women a natural slowness to change an ancient faith (on the side of Buddhist conversion), and a natural tendency for immigrants to leave their women folk behind.

* Still in India a man generally gives the return for his women folk. If he returns himself as a Bráhman, he will hardly return his wife as a Kammálan.

CHAPTER VI.

INFIRMITY (TABLE IX).

Table IX shows the sufferers from leprosy, insanity, blindness and deaf-mutism throughout the city. I question whether any conclusion can be drawn from it. Taking leprosy first, the great predominance of lepers in Division II is due to the fact that the leper hospital is situated there. As regards the rest of the city I doubt whether the return is accurate. Leprosy, especially among females, is not generally the subject of advertisement.

Insanity is localised in Division XIV, where is the Lunatic Asylum. Again the completeness of the return may be doubted. A person must be very mad in India before lunacy will be admitted by his or her relatives; still more so before the patient is placed under restraint.

I give for what they are worth the comparative figures of 1901 and 1911. A decrease in blindness is noticeable; but a return of 175 blind people in a population of over half a million appears to be grotesquely inaccurate.

Infirmity.	1901.			1911.		
	Males.	Females.	Total.	Males.	Females.	Total.
Leprosy	299	94	393	200	72	272
Insanity	355	121	476	452	173	625
Blindness	158	123	281	87	88	175
Deaf-mutism	92	60	152	129	68	197

CHAPTER VII.

THE INDUSTRIES OF MADRAS (TABLE X).

(By Alfred Chatterton.)

Although Madras is in respect to population the third city in India, it is, from an industrial point of view, of small importance. Founded as a factory of the East India Company in the year 1640, it owes its growth to political rather than economic causes. Before the advent of railways and steamers it was as conveniently situated as any other town on the surf-bound Coromandel Coast for trading, and, as the centre of the East India Company's administration, it gradually grew into commercial importance, and ultimately, as the capital of the Southern Presidency, it became a city with a large population. In the middle of the nineteenth century it was relatively a town of greater industrial importance than it is now, as in those days indigenous industries flourished, and there were a number of important Government factories. When the East India Company ceased to carry on trade, the foreign business passed almost entirely into the hands of European houses of Agency, and although they displayed considerable enterprise in endeavouring to establish industries on a large scale in the country, their efforts met with little success, and up to the present day trade has proved more remunerative than manufacture. The reasons for this may be summarised briefly :—

- (1) The natural poverty of the country and the lack of raw materials as a basis for manufacturing operations.
- (2) The indigenous industries were of a very primitive type and entirely in the hands of uneducated artizans.
- (3) The non-official European community was drawn more from the commercial than the manufacturing classes, and their natural inclination was rather to finance agriculture and develop trade, than risk their capital in industrial work, of which they had but little practical knowledge.
- (4) The limited market for specialised manufactures, due to the poverty of the people and the want of facilities for transport.

In respect to fuel, a large and cheap supply of which is essential to the establishment of modern industries, Madras is severely handicapped. The nearest coal field is at Singareni in the Nizam's Dominions, but the bulk of its output goes West, and the coal supply of Madras is mainly obtained from Bengal either by rail or sea. The price of coal in Madras fluctuates considerably, and may be taken to average not less than Rs. 13 per ton. At one time wood was fairly cheap and was largely used for generating steam, but of late years the price has risen to from Rs. 11 to Rs. 13 a ton, and it is now mainly brought into Madras for domestic consumption, the average amount so used being about 110,000 tons per annum. In recent years very great improvements have been made in the methods of generating power, chiefly through the introduction of internal combustion engines, the advantages of which are most apparent when comparatively small amounts of power are required. The effect of this is beginning to be felt, which fact, combined with the present tendency of the educated classes of the country to turn their attention to industrial questions, has during the last few years induced a distinct movement in favour of industrial occupations. The material results so far achieved are not very important, but now that a start has been made, it can hardly be doubted that in time great changes will be effected.

In competition with the West, whilst India is at a disadvantage in many matters, it possesses an asset of enormous importance in its abundant supply of cheap labour. It is true that at the present time this labour is both unskilled and inefficient, but that this can be remedied by a practical system of industrial education has already been proved on a scale by no means insignificant. The results obtained in the mill industries, with labour still partially dependent upon agriculture, are no fair criterion by which to estimate the relative costs of labour in Eastern and Western countries. Far better results, though on a much smaller scale, have been obtained in factories which employ workmen who are artizans by caste, and possess a certain amount of hereditary aptitude for industrial work. In engineering shops, foundries and allied

factories, although the workmen are still far below the standard of capacity to be found in England, yet under careful supervision they can be got to turn out thoroughly satisfactory work at a very much lower cost. In such shops the Indian workman earns about one-sixth of the pay, and does from one-third to one-half as much work as is the current practice in England, and is therefore a much cheaper workman.

The total population of Madras on the night of the Census was 518,660, and of these only 48,088 can be regarded as directly engaged in productive industrial work.

The following figures extracted from Table X of the Madras City Returns show in detail the number of persons engaged in the various industrial occupations pursued in the city :—

DESCRIPTION OF OCCUPATION.	WORKERS.		
	Male.	Female.	Total.
	Class B.		
Order VI. Textiles	10,800	1,136	11,936
" VII. Hides and skins, etc.	292	15	307
" VIII. Wood	4,399	144	4,543
" IX. Metals	3,306	43	3,349
" X. Ceramics	470	183	653
" XI. Chemical products, etc.	458	20	478
" XII. Food industries	1,478	2,694	4,172
" XIII. Industries of dress	5,163	772	5,935
" XIV. Furniture	150	9	159
" XV. Building industries	4,340	707	5,047
" XVI. Construction of means of transport	361	6	367
" XVII. Production and transformation of energy	369	13	382
" XVIII. Industries of luxury, printing, book-binding, jewellery and games	10,633	127	10,760
	42,219	5,869	48,088

From this it will be seen that there are 42,219 men and 5,869 women engaged in industries. Female labour is almost entirely confined to the textile trades, the food industries and those connected with clothing. The returns of building industries also include a considerable number of females who really belong to the cooly class, as their labour is entirely unskilled.

The next statement furnishes detailed information regarding the employment of labour in power factories :—

Total	50	25									

The Census returns include a very large proportion of the employees of the locomotive workshops of the Madras and Southern Mahratta Railway, which lie outside the municipal limits to the north-west of Madras, and, at the same time, they do not include a considerable number of employees in the big cotton mills of Perambur, who reside outside the municipal limits. It is impossible, therefore, to state with any approach to accuracy the number of artizans working on their own account or associated in small groups. Roughly, however, the number may be taken at about 10,000, the bulk of whom are carpenters, metal-workers, jewellers and men engaged in the building trade.

Owing to differences in classification it has been found impossible to compare the numbers obtained in the Census of 1901 with the numbers obtained in the Census of 1911, except in a few cases which are given herewith :—

Number.	Occupation.	Workers.	
		1901.	1911.
1	Oil milling	219	250
2	Rice milling	3,605	1,888
3	Æerated water manufacture	46	74
4	Lime and cement manufacture	541	483
5	Cotton ginning	1,237	339
6	Cotton spinning and weaving in factories	2,950	5,878
7	Cotton weaving (hand)	3,999	3,958
8	Brass, copper and bell-metal workers	323	408
9	Carpenters	3,272	4,236
10	Shoe, boot and sandal makers	1,109	1,229
11	Jewellery	3,239	4,424

Examination of the statement will show that during the last ten years there have been considerable changes. There has been a great diminution in the number of rice pounders and huskers, doubtless owing to the large number of rice mills which have been established during the decade, so that rice instead of paddy is now brought into Madras. For reasons probably similar the amount of cotton ginning done in Madras has decreased to an even greater extent. During the last ten years only one cotton mill has been established, but there has been a considerable expansion in the output of those already established, necessitating a large increase in the number of people employed. It is interesting to note that the number of hand-loom weavers is practically the same as at the previous Census, and that apparently they are able to hold their own against the competition of power-loom factories. There has been some slight increase in the number of metal workers, and a considerable increase in the number of carpenters and jewellers, which may be taken as a not unfair indication of increased prosperity.

As might be expected in a capital city with a large population, there are a vast number of miscellaneous industries carried on, but none of them have obtained any considerable development and in the main they serve only to supply the local needs. The cost of living in Madras is distinctly higher than in other parts of the Presidency, and the pressure of foreign competition is therefore the more strongly felt by the indigenous artizans in the city than elsewhere. Moreover, in a seaport indigenous industries do not enjoy the small measure of protection afforded by the cost of transport to inland centres of population. It may be taken, therefore, as certain that the decay in the old industries of the country is more complete in Madras than elsewhere, and that the industrial future depends entirely upon the advantages offered by the city as a distributing centre for manufacture conducted on a large scale and on modern lines.

The next statement is a complete list of the organised industries using power in Madras and carried on in workshops employing more than twenty hands :—

	NO.		NO.
1. Cotton Mills	4	11. Baling Presses	4
2. Iron Works	9	12. Carpenter's Shops	7
3. Engineering Shops—		13. Leather { Tannery	1

7. Tin-plate Works	2		
8. Aluminium Works	1		
9. Glass Works	1		
10. Saw Mill	1		
		Total ..	<u>101</u>

By far the greater number of these are engaged in supplying the local needs of the community and are such as could be found in almost every large city: in fact, from an industrial point of view, only the four cotton mills, the cement works, two or three Iron Works and the aluminium factory are of commercial importance. The bulk oil installations, however, which do a very large business and are of great economic value, deserve attention. They are the direct outcome of the harbour works, without which it would have been impossible for them to have been established. During the last ten years the consumption of mineral oils has increased enormously in India and especially in the Madras Presidency, where very large quantities are now used in the numerous oil-engines which have been set up. In regard to the supply of liquid fuel, which is the residue left after the lighter oils have been distilled from crude petroleum, Madras compares not unfavourably with most other parts of the world which have not oil fields in their immediate neighbourhood. This is an industrial asset of no small importance, and will tend in the future to counterbalance largely the disadvantages, from which in other respects Madras suffers in the matter of fuel supply. Although there is only one tannery, and that of a specialised character, within the municipal limits, Madras is really a very important centre of the leather trade, and outside the municipal limits in the Chingleput district there are a large number of tanneries, mainly engaged in the preparation of hides and skins for export to Europe and America.

The following figures compiled from information kindly supplied by all the power users in Madras are interesting as showing the extent to which hand labour is assisted by modern methods of generating power :—

—	Number of engines.	Indicated or brake horse-power.	
Steam engines	63	13,250	I.H.P.
Gas engines	15	499	B.H.P.
Oil-engines	54	742	B.H.P.
Electric motors	104	534	B.H.P.

The figures for the horse-power are probably not very accurate, especially in respect to steam engines, many of which are old; and it will be safe to make a deduction of at least one-third to arrive at the actual horse-power daily generated. The cotton mills and the generating station of the Electric Supply Company account for the great bulk of the steam power. In all there are only 63 steam engines in Madras, as compared with 69 motors of the internal combustion type using either suction gas, liquid fuel, or kerosine oil. The latter have been installed within the

last few years, and the extent to which power is now used to supplement hand-labour is shown by the fact that, in addition, 104 motors aggregating 534 horse-power have been attached to the mains of the Electric Supply Company. At 4 annas per kilowatt per hour the cost of power obtained in this way is very high, especially when allowance is made for the fact that small electric motors have a low efficiency. On a larger scale electric power is offered at somewhat lower rates, but for a steady load the terms offered are not sufficiently favourable to induce owners of generating plants to abandon them, or to prevent new private installations coming into existence. Nevertheless owing to the steadily increasing cost of labour an even more extended use of the facilities offered by the Electric Supply Company may be expected, whenever a very small or an intermittent supply of power is required. Ordinarily, however, except for very small units of power, or for supplies required intermittently, the use of internal combustion motors, whether worked by oil or gas, will be found more economical.

A careful scrutiny of the list of factories in Madras shows that in recent years only three new industries have been introduced into the city :--

(1) The manufacture of aluminium utensils now carried on by the Indian Aluminium Company.

(2) The manufacture of leather by the chrome tanning process carried on by Messrs. Chambers & Co.

(3) The manufacture of glass, chiefly sodawater bottles, by the Madras Glass Works.

The first two have passed the experimental stage and may be regarded as firmly established industries. In the older industries, there has been a considerable expansion in the outturn of the spinning and weaving mills, and a notable feature is the dye-houses attached to two of them. There has also been a considerable development in the engineering trades, consequent upon the extended use of motive power and machinery throughout the Presidency.

APPENDICES.
